# Signal classification

- many ways in which signal may be classified, i.e. periodic, when x(t) = x(t+T), where the smallest value of T defines the period
- we can also classify signals as either energy or power signals
- energy signals
  - non-zero and finite total dissipated energy, E
  - usually exist for a finite interval of time or have most of their energy concentrated in a finite interval of time

 $0 \le E \le \infty$ ,  $E = \int_{-\infty}^{\infty} x^2(t) dt$ 

- power signals
  - non-zero and finite average delivered power, P an example is the unit step function u(t) and a periodic signal of period T such as  $x(t)=\sin(2\pi t/T)$

 $0 \le P \le \infty \qquad P = \lim_{T \to \infty} \frac{1}{T} \int_{-T}^{T} x^2(t) dt = \frac{1}{T} \int_{0}^{T} x^2(t) dt$ 

### Example

Find the energy in the decaying exponential signal  $x_1(t)$ =5exp(-2t) if  $t \ge 0$  and  $x_1(t) = 0$  if t < 0.

Signal representation and system response

98

Energy = 
$$\int_{0}^{\infty} (x)^{2} dt = \int_{0}^{\infty} 25 \exp(-4t) dt = \frac{-25}{4} \left[ \exp(-4t) \right]_{0}^{\infty}$$
  
=  $\frac{25}{4}$ 

## Fourier series

## Trigonometric Fourier series

we can represent any finite power periodic signal x(t) with a period T as a sum of sine and cosine

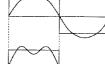

$$x(t) = \frac{A_0}{2} + \sum_{n=1}^{\infty} A_n \cos(n\omega_0 t) + B_n \sin(n\omega_0 t)$$

fundamental frequency:

$$\omega_0 = 2\pi/T \text{ rad/s}$$
 or  $1/T \text{ Hz}$ 

(b)

harmonics are generally found at  $2/T\,\mathrm{Hz}$ ,  $3/T\,\mathrm{Hz}$  ... according to Fourier coefficients:

$$A_n = \frac{2}{T} \int_{T/2}^{T/2} x(t) \cos(n\omega_0 t) dt \quad n = 0, 1, 2, ...$$

$$B_n = \frac{2}{T} \int_{-T/2}^{T/2} x(t) \sin(n\omega_0 t) dt \quad n = 1, 2, 3, ...$$

### Example

Evaluate the Fourier series of the square wave (a)

An= ) x(t) cos(nort) elt

The period T of he squeet wave = 25 wo= 20 = 20 = 20

E U

For even values of a the B wells are

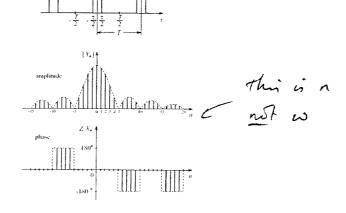

The bigometic forme seies representation of he waveform in 12(t) = \( \frac{2}{n\pi} \left( 1-cos(n\pi) \right) \sin (M\pi t)

ニバ

## Example

Derive an expression for the complex Fourier coefficient,  $X_n$ , associated with

the periodic signal x(t):

$$\begin{aligned}
\chi_{n} &= \frac{1}{T} \int_{-T/2}^{T/2} \chi(t) \exp(-jn\omega_{0}t) dt \\
&= \frac{1}{T} \int_{-T/2}^{T/2} A \exp(-jn\omega_{0}t) dt \\
&= \frac{-A}{jn\omega_{0}T} \left[ \exp(-jn\omega_{0}t) - \exp(jn\omega_{0}t) \right] \\
&= \frac{At}{T} \sin(n\omega_{0}t/2) \\
&= \frac{At}{T} \sin(n\omega_{0}t/2) \\
&= \frac{At}{T} \sin(n\omega_{0}t/2)
\end{aligned}$$

## Orthogonality

- we already looked at the concept of othogonality last time (i.e. QR decomposition and Gram-Schmidt)
- the Fourier series is an orthogonal expansion
- we say two signals  $f_1(t)$  and  $f_2(t)$  are orthogonal if  $\frac{1}{T} \int_{-T/2}^{T/2} f_1(t) f_2(t) dt = 0$

and for the complex Fourier series the basis functions are mutually orthogonal:

$$\frac{1}{T} \int_{-T/2}^{T/2} \exp(jn\omega_0 t) \exp^*(jm\omega_0 t) = \begin{cases} 1 & \text{if } m = n \\ 0 & \text{if } m \neq n \end{cases}$$

### Example

Calculate the power in the simple periodic signal x(t) where:

$$x(t) = a_1 \sin(\omega_0 t) + a_2 \sin(2\omega_0 t)$$

Signal representation and system response

104

$$P = \frac{1}{T} \int_{0}^{T} x^{2}(t) dt$$

$$= \frac{1}{T} \int_{0}^{T} a_{1}^{2} \sin^{2}(\omega t) dt + \frac{2}{T} \int_{0}^{T} a_{1} a_{2} \sin(\omega t) \sin(2\omega t) dt$$

$$+ \frac{1}{T} \int_{0}^{T} a_{1}^{2} \sin^{2}(2\omega t) dt$$

$$=\frac{\alpha^2+\alpha^2}{2}$$

therefore we have 
$$X(\omega) = \int_{-\infty}^{\infty} x(t) \exp(-j\omega t) dt$$

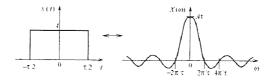

$$x(t) = \lim_{T \to \infty} \sum_{n=-\infty}^{+\infty} X_n \exp(jn\omega_0 t) \frac{\omega_0}{2\pi}$$

$$x(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(\omega) \exp(j\omega t) d\omega$$

and we can represent most finite energy signal in this way

### Example

Evaluate the Fourier transform of the finite energy signal x(t)

$$X(u) = \int_{-\infty}^{\infty} Y(t) \exp(-jut) dt$$

$$= A \int_{-\infty}^{\infty} \exp(-jut) dt = A \left[ \frac{-1}{jw} \exp(-jut) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

$$= A \left[ -\frac{1}{jw} \exp(-jwx) + \frac{1}{jw} \exp(-jwx) \right]_{-\infty}^{\infty} (t)$$

# Applicability and physical interpretation

 the basis functions of the Laplace transform are growing or decaying complex phasors

$$A \exp(st) = A \exp(\sigma t) \cos(\omega t) + jA \exp(\sigma t) \sin(\omega t)$$

- the signal x(t) has components with
  - frequency  $\omega$
  - magnitude  $|X(s)|d\omega/(2\pi)$
  - $\sigma$  growth or decay determined by  $\sigma$
  - phase  $\angle X(s)$

### Example

Evaluate the Laplace transform of a one-sided signal  $x(t) = \exp(-\alpha t)$ 

Signal representation and system response

114

$$X(s) = \int_{0}^{\infty} \exp(-\alpha t) \exp(-st) dt$$

$$= \int_{0}^{\infty} \exp(-(s+\alpha)t) dt$$

$$= \frac{-1}{s+\alpha} \left[ \exp(-(s+\alpha)t) \right]_{0}^{\infty}$$
Then provided that  $Re(s) = \sigma > -\alpha$ 
The function  $\exp(-(s+\alpha)t) = 0$  as  $t = -\infty$ 
The function  $\exp(-(s+\alpha)t) = 0$  as  $t = -\infty$ 

$$X(s) = \frac{1}{s+\alpha}$$

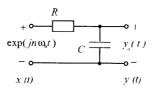

# Transform analysis of linear systems Linear ordinary differential equations

many linear systems can be modelled with linear ordinary differential equations  $a_0 y + a_1 \frac{dy}{dt} + ... + a_n \frac{d^n y}{dt^n} = b_0 x + b_1 \frac{dx}{dt} + ... + b_m \frac{d^m x}{dt^m}$ 

where the input, x(t), defines the output, y(t), according to system parameters  $a_0 \dots a_n$  and  $b_0 \dots b_m$ 

## Example

Evaluate the response  $y_n(t)$  of the following circuit to  $n^{th}$  harmonic, i.e. the complex phasor  $\exp(jn\omega_0 t)$ 

(Ising Kirchoff's laws (2nd law - algebraic sum of rollings dops around any closed larp = a)
The system can be described by the differential equation

Transant response due to initial condition will have decayed to zero long ago

Assume a solution of the form you (joust)

a. Kenglinust) + a. K(jnw.) explinust) = b. enplinust)

$$K = \frac{bo}{a_0 + a_1 j r w_0}$$

: the response 
$$y_n(t) = \frac{bs}{as + a, jaso} \exp(jasot)$$

# Laplace transfer function

defined in the same way as for the Fourier transfer function

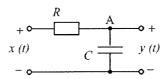

$$H_s = \frac{L[\text{output}]}{L[\text{input}]} = \frac{Y(s)}{X(s)}$$

and completely specifies system characteristics

 with knowledge of the transfer function we can calculate the response of the system to any input

## Example

Evaluate the transfer function of the following circuit:

MathEng - Lecture 2b: Signal representation and system response

123

$$\frac{x(t)-x_1(t)}{n}=c\frac{dy}{dt}$$

$$\frac{x(t)}{R} = C \frac{dy}{dt} + y(t)$$

& taking laplace transforms

$$\frac{X(s)}{R} = C \left\{ sY(s) - Y(o^{-}) \right\} + \frac{Y(s)}{R}$$

$$\frac{\chi(s)}{R} : \left\{ \left( s + \frac{1}{R} \right) \right\} / s$$

$$H(s) = \frac{Y(s)}{X(s)} : \frac{1}{1 + R(s)}$$
